

TICKET4TRAVEL SUITE

TICKET4TRAVEL is a **complete suite** that brings together flights, trains and hotels in a single structured file. It is a **modular platform** designed for professional travel, built to adapt to daily operational complexity and simplify the management of bookings. All bookings created using the components of **TICKET4TRAVEL SKYTOOL4CONSOLIDATOR, RAILTOOL AND HOTELTOOL** are brought together in a **centralised case management** system, allowing agencies to work on complete, orderly and perfectly **integrated customer files**.

TICKET4TRAVEL is a suite that integrates and enhances all the functionalities of its components: **SKYTOOL4CONSOLIDATOR, RAILTOOL AND HOTELTOOL**, while **maintaining their operational, technological and commercial characteristics intact**. It is not a container, but a coherent system in which each module retains its own strength and contributes to a unified, **structured and strategic management of travel files**.

The complete suite

Independent
TICKET4TRAVEL is designed to work exclusively with the benefits negotiated by the customer. It does not impose its own rates, does not apply percentages on turnover and does not erode margins with hidden logic. The economic conditions remain those defined by the agency, consolidator or tour operator. **The value you build remains entirely yours.**

Complete and secure
TICKET4TRAVEL Guarantees completeness in every operational situation, process security, commercial flexibility and technical simplicity, even in payment systems. **It integrates fraud prevention tools**, conditional issuance based on payment outcome and structured control of practices. **Every variable is manageable.**

Operational Continuity
TICKET4TRAVEL also works when you are not present:
| Automatically reads codes and PNRs
| Intercepts operational changes
| Maintains a complete history and notifies relevant events
| Automates recurring checks
| Communicates with back office and accounting
| Reduces micro-interruptions and corrective interventions.
Operations remain active 24/7.

Scalable
TICKET4TRAVEL is designed to grow with your organisation. It can be used within your own network of agencies with **your own dedicated brand**, supporting multi-level organisations, unlimited sub-agencies, **configurable permissions and selective access to content and markets**. As a SaaS platform, it adapts to volumes, territories and distribution models **without requiring complex infrastructure**.

Simple
TICKET4TRAVEL has a clear interface and straightforward operating logic. Designed for a **minimal learning curve**, even for operators and sales networks that need to work quickly. **Simplicity that makes power accessible.**

Made by people
TICKET4TRAVEL is a suite designed, developed and tested every day by professionals with real-world travel experience. People who understand the processes, critical issues and responsibilities of daily operations and transform this knowledge into real solutions.

TICKET4TRAVEL SUITE

The coherent ecosystem that unifies ticketing with control, flexibility and reliability.

- Governance and control
- Modular and scalable architecture
- Governance of the entire agency network
- Total traceability of operations
- Advanced margin management
- Maximum payment flexibility

A coherent system in which each module retains its own strength and contributes to the unified, structured and strategic management of travel arrangements. A platform designed to build independence, scalability and commercial solidity.

For Tour Operators & network of agencies

It means centralising governance, flows and operating standards while maintaining distribution autonomy.

For consolidator

It orchestrates volumes, rates, sub-agencies and payment systems with scalable and traceable logic.

The suite that integrates three specialised platforms designed to work together in a single operating infrastructure.

Air Booking Platform
| Complete integration of flights from GDS (including NDC) and major NDC and low-cost aggregators
| Control of content, mark-ups, rules and issuance policies
| Anti-fraud validation and ADM risk monitoring
| 24/7 issuance and operations

Train Booking Platform
| Integration of major national and international rail operators
| Coordinated management of routes within the same travel file
| Uniformity of process between air and rail, without operational fragmentation

Hotel Booking Platform
| Access to major bed banks
| Integration of hotel bookings into the same management logic as the file
| Traceability and margin control on each component

TICKET4TRAVEL SUITE

The coherent ecosystem that unifies ticketing with control, flexibility and reliability.

By **Infotech** Since 1997
Engineering for Travel Business

The **one-stop shop** tool for professional airline ticketing that unifies what is normally fragmented into a single operating environment: traditional **GDS and multi-PCC, NDC aggregators, low cost, direct connections with airlines.** SKYTOOL allows you to work with your own GDS, your own fares and your own commercial agreements, **without intermediation on economic conditions.**

Markups and fees remain under the control of the consolidator and sub-agency, configurable manually or automatically, visible or incorporated, without external interference on the value built.

SKYTOOL works with all sources

- | **GDS**
Travelport, Amadeus, Sabre and NDC version - Low Cost
- | **NDC and Low Cost Aggregators**
AirGateway, TravelFusion, Farelogix and OneFly
- | **Direct Connections Airlines**
AirArabia, AirMaroc, Turkish Airlines, Emirates, FlyDubai

Main Features

- | **Fast Selection Rules (FSR)**
- | **Parallel multi-GDS / Multi FSR search**
- | **Complete PNR management**
- | **24/7 issuance**
- | **EMD, SSR, DOCS, Ancillary**
- | **Manual Fare Optimizer**
- | **Over 400 configurable functions**
- | **Airline blocking**
- | **POS control**
- | **Anti-ADM validations**
- | **Automatic monitoring & checking**

Multi-level governance

1 Master agency, unlimited sub-agencies with configurable permissions. SKYTOOL automatically **rereads codes and PNRs**, intercepts operational changes and relevant events, generating appropriate **notifications both in pop-ups and via email**, maintaining a complete history and transforming the unexpected into a manageable process.

Advanced financial management

Markups applicable for individual agencies, sub-agencies or channels; fraud and ADM prevention, POS and FOP validations, anti-churning controls, automatic blocking of improper practices, 24/7 issuance with reduced operational risk.

Complete management of collections and payments

authorised cards, immediate and irrevocable transfers, wallets, preloaded credit, online collections, issuance conditional on payment outcome. Integration with back-office and accounting, automation of recurring checks, reduction of micro-interruptions.

Platform for consolidators dedicated to the professional management of rail transfers, designed to integrate train **ticket search and issuance** into an advanced booking ecosystem. It allows you to work with the main Italian railway companies, including **Trenitalia, Italo and Trainline**, offering **centralised access to multiple content sources.**

RAILTOOL is designed to expand and diversify the available rail sources, allowing **parallel searches** between different providers and real-time **comparison of solutions, availability and the most convenient fare conditions.**

It does not offer its own rail fares and **does not act as a commercial intermediary**: it only provides the technology necessary to use the content that the operator can contract in **complete autonomy.** In this way, consolidators **maintain full control over agreements, economic conditions and margins.**

RAILTOOL also **complements SKYTOOL**: it was created to integrate **rail transport with air ticketing**, allowing trains to be added to flights within the same operational flow.

This makes it possible to **build multimodal flight + train solutions** with managerial consistency, process continuity and a **unified view** of the itinerary.

The platform fits naturally into existing booking systems, transforming rail transport into a **strategic component of the offering.** RAILTOOL does not replace the consolidator's commercial relationships, but enhances them through a flexible, **scalable and fully autonomous infrastructure.**

Professional accommodation management, designed to **integrate hotel search and booking into a structured operating environment.**

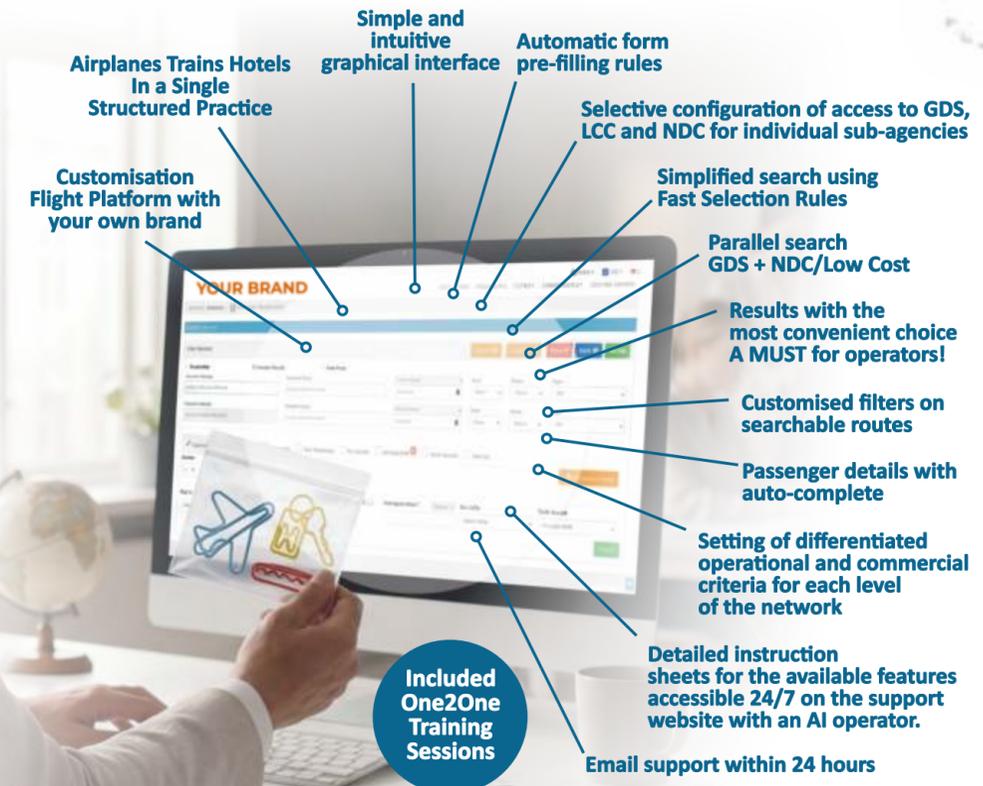

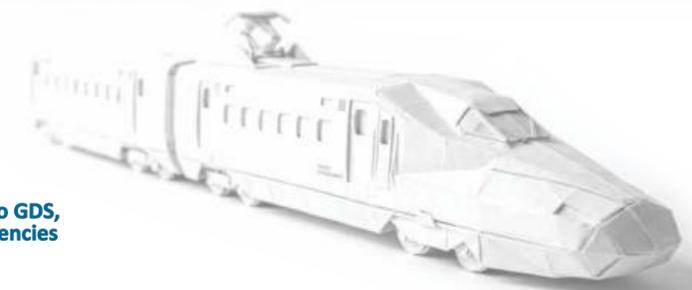

It provides access to most of the major **international BedBanks, including Hotelbeds, Restel, Sunhotels** and other similar suppliers, offering a unified access point to multiple content sources.

The platform is designed to **expand and diversify hotel product sources, allowing parallel searches across different BedBanks.**

This allows you to **compare availability, conditions, categories and rates in real time**, improving the quality of the commercial offer and the efficiency of the sales process.

HOTELTOOL does not offer its own rates nor does it act as a direct commercial intermediary. It exclusively provides the **technological infrastructure to use accommodation products contracted independently** with selected BedBanks. The operator thus maintains full control over agreements, economic conditions and margins.

Complementary to **SKYTOOL and RAILTOOL, HOTELTOOL** allows the hotel **segment to be integrated with air and rail ticketing**, contributing to the creation of complete and consistent solutions within the same operational flow. The result is a **multimodal and multi-product environment** that combines technology, commercial autonomy and the ability to aggregate offerings in a single **scalable system.**
